

Role-Based Access Model for WIL Hub

1. User Roles Table

The system uses a single Users table to manage authentication and authorization across all parties.

Schema:

- **user_id (PK, UUID)**
- **email**
- **password_hash (for login)**
- **role (enum: student, company_admin, institution_admin, super_admin)**
- **linked_id (FK → student_id OR company_id OR institution_id depending on role)**

Purpose: This ensures one authentication system covers all three parties, while linking each user to their respective entity record.

2. Institution Admin Permissions

Institution admins have elevated privileges but do not recruit directly. Their responsibilities include:

- **Verify students → set eligibility_status to provisional or verified.**
- **Approve company postings → change posting_status from pending → approved.**
- **Validate matches → update match_status.**
- **Track placements → confirm start_date, end_date, and completion_status.**
- **Generate reports → record graduation impact and compliance notes.**

3. Access Control

Role-based restrictions ensure each party only sees and edits what's relevant:

- **Students:**
 - **Edit their own profile (CV, skills, availability).**
 - **Apply to programs.**
 - **View application and placement status.**
- **Companies:**

- Post WIL programs.
- View applicants.
- Update application statuses (shortlist, select, reject).
- **Institutions:**
 - View all students under their institution.
 - Approve postings for compliance.
 - Validate matches.
 - Track placements and generate reports.
- **Super Admin (platform owner):**
 - Manage institutions and companies globally.
 - Oversee system health and user accounts.

4. Workflow Example

- Student logs in → sees dashboard with CV, eligibility status, and applications.
- Company logs in → posts WIL program, views applicants, updates statuses.
- Institution logs in → dashboard shows pending verifications, pending postings, placement tracking.
- Super Admin logs in → oversees institutions, companies, and system metrics.

Why This Matters

This role-based access model ensures:

- Institutions don't need to merge databases — they simply log in and perform verification tasks.
- Companies get a clean interface for posting and shortlisting.
- Students get a trusted portal with verified opportunities.
- Super Admin maintains control and governance of the platform.
